# A Thought Experiment

- Imagine a  $\text{NO}_3$  time series for a Well
- We don't know the exact source area, but we have some suspicions.

- What can this well tell us about leaching concentrations in the source zone.

Left-hand Matt\*

Source = 10  
mg/L Now!

# A disagreement

Right-hand matt\*

Source = 5  
mg/L NOW!

Who is correct (*right is problematic*):

- A) Right handed Matt
- B) Left handed Matt
- C) No earthly way to know

\* A Chirality joke for the 1.5 hardcore chemists in the audience

Left-hand Matt\*

# A disagreement

Now with Lag!™  
MRT = 25 y, P1 = 0.7 and Pathways!

Right-hand matt\*

Who is correct (*right is problematic*):

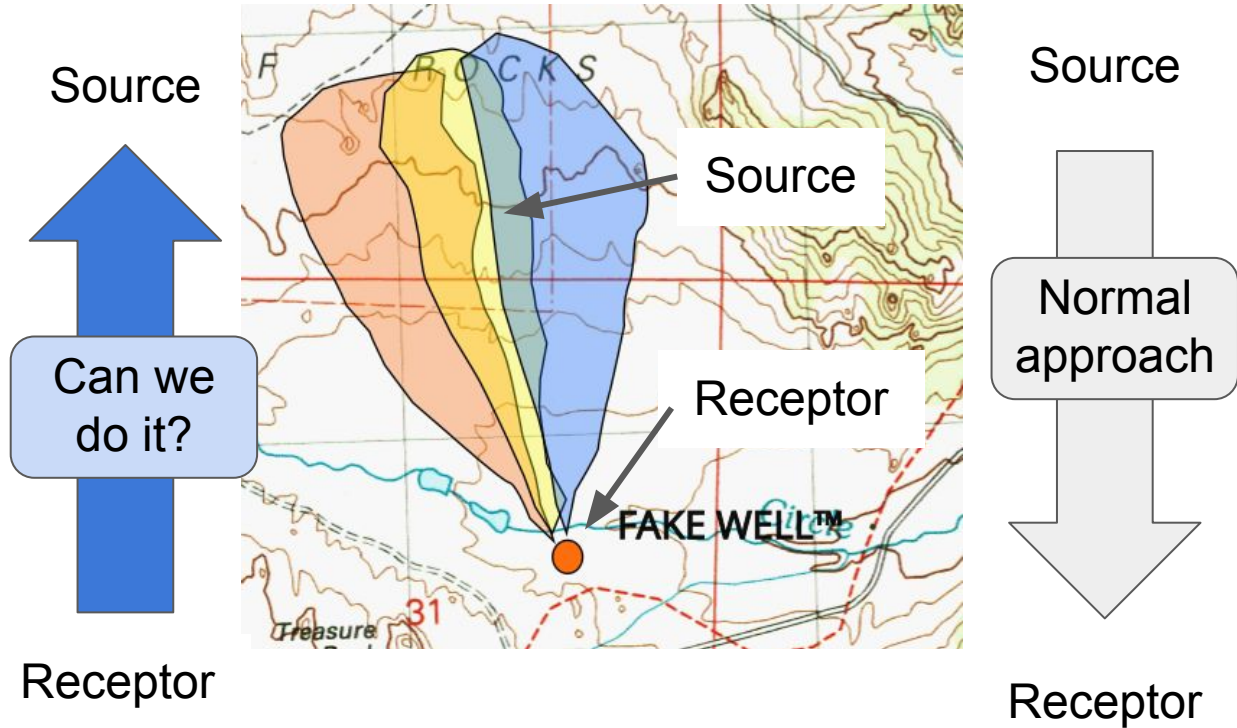

- A) Right handed Matt
- B) Left handed Matt
- C) No earthly way to know

# Can understand the source from the receptor?

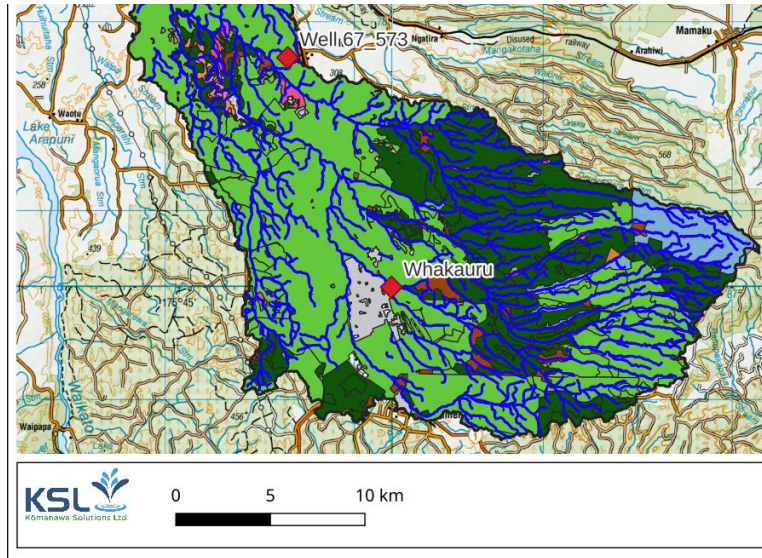

Goal:

- Quantify the historical source concentration
- Predict future receptor concentrations

# How? Let's set the scene

MRT = 12, F\_P1 = 0.7

- Baseflow dominated hydrology
- History of intensification in some catchments, e.g. major forest to dairy conversion in Whakauru catchment in 2008-2009

NO<sub>3</sub>-N at Whakauru Stream

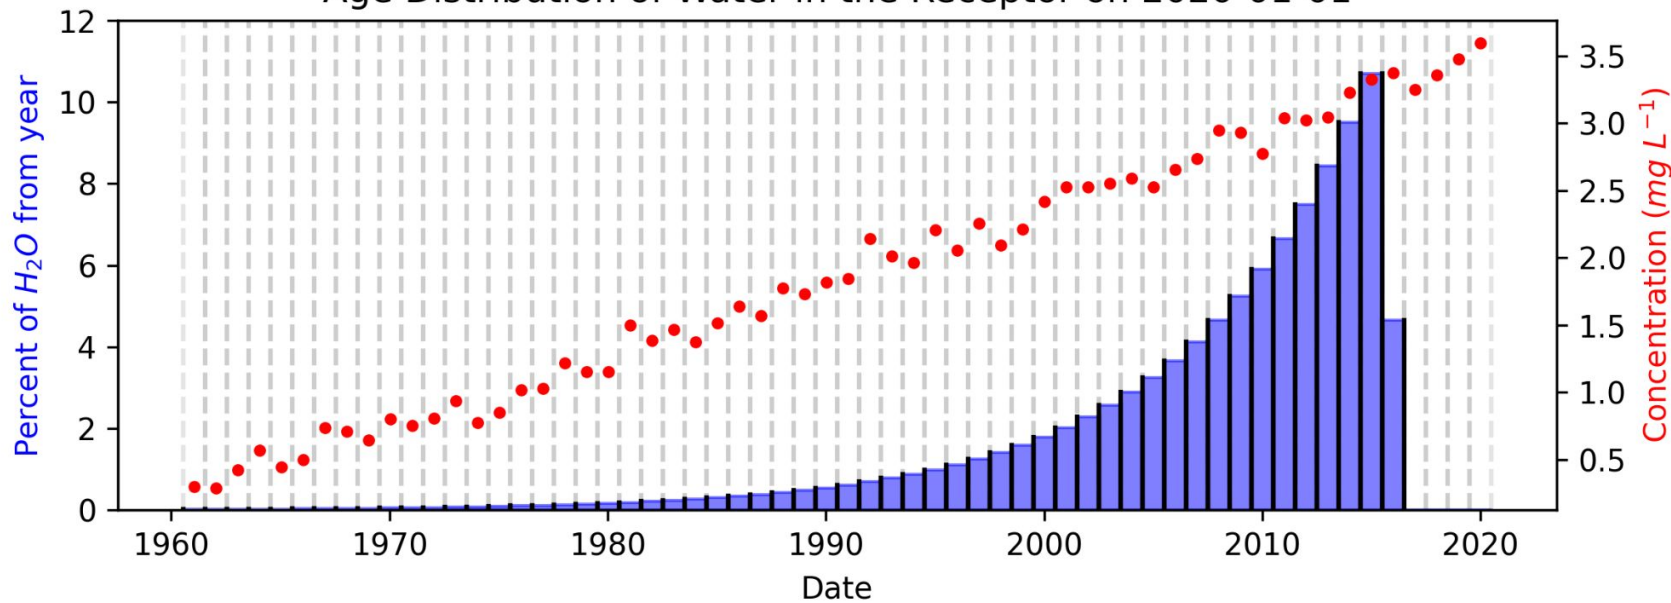

# How? How do we link source concentrations to the receptor?

Age Model: Exponential Piston Flow - fit from Tritium

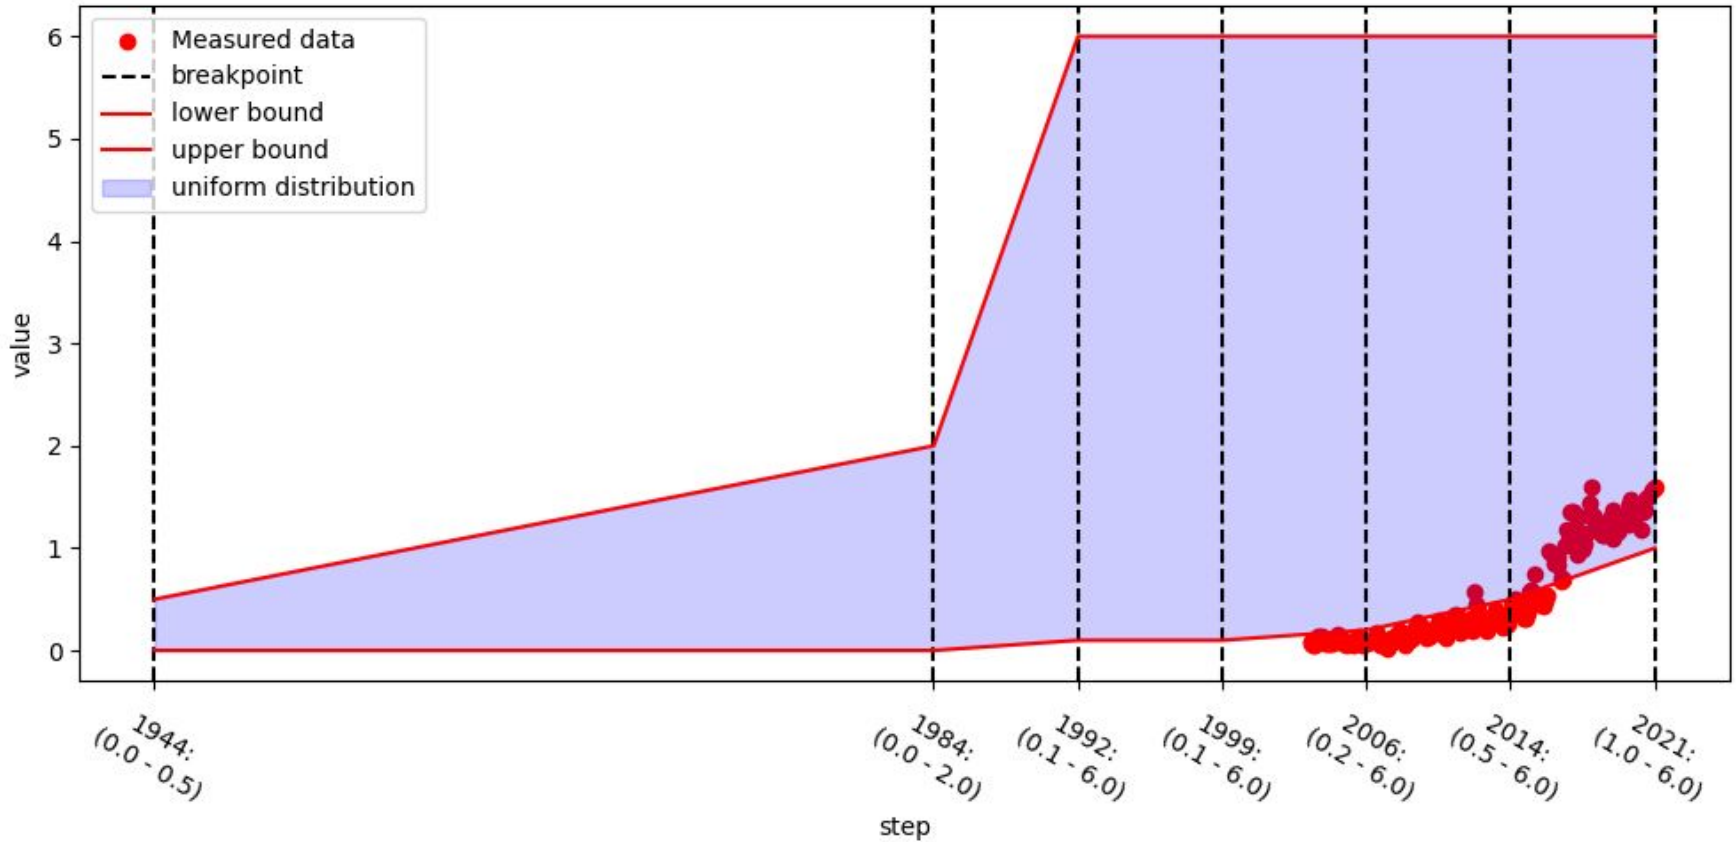

MRT = 12, F\_P1 = 0.7

$$Conc_n = \sum_{a=0}^p Conc_a \times age\ percent_a$$

Age Distribution of Water in the Receptor on 2020-01-01

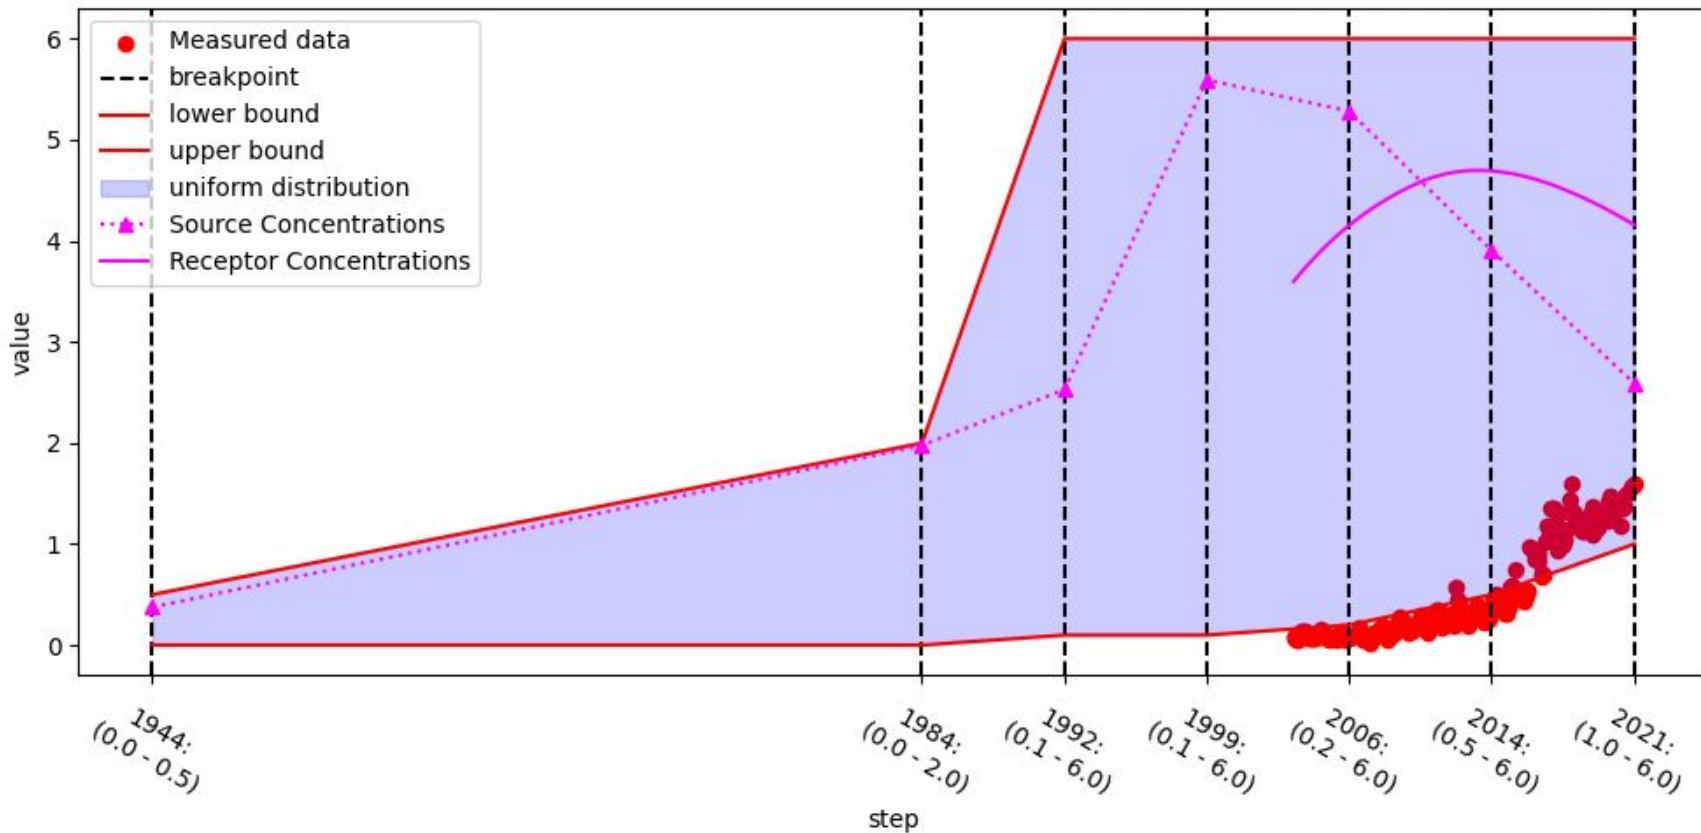

# How? Consider all reasonable source concentrations (The Prior)

How? Let's select 1 and try it out

NOPE!

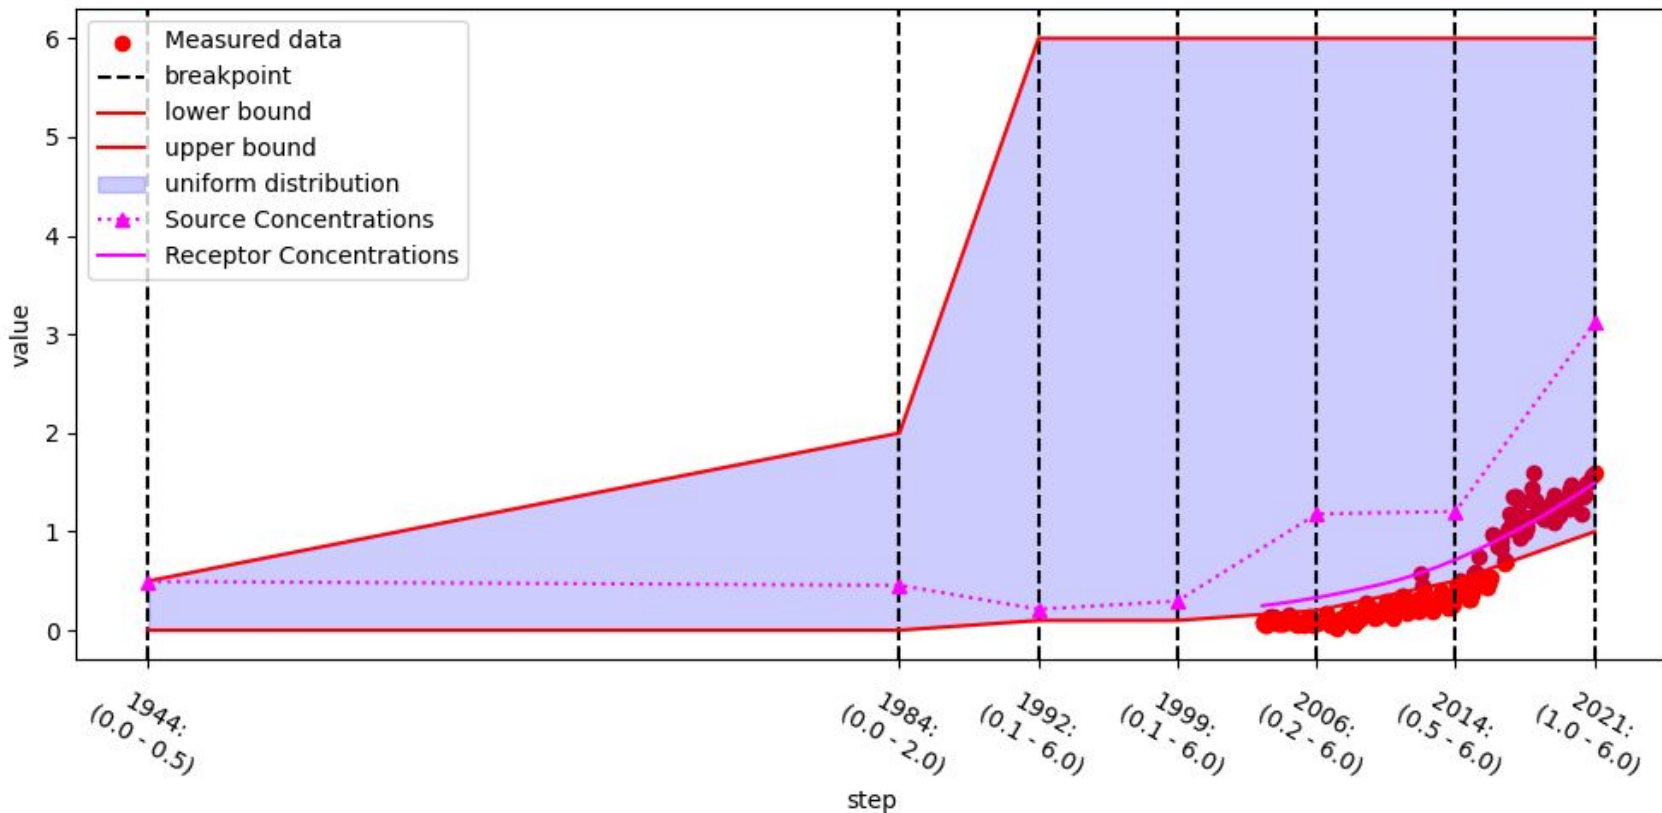

# How? Let's select another and try it out

**Better shape,  
but NOPE!**

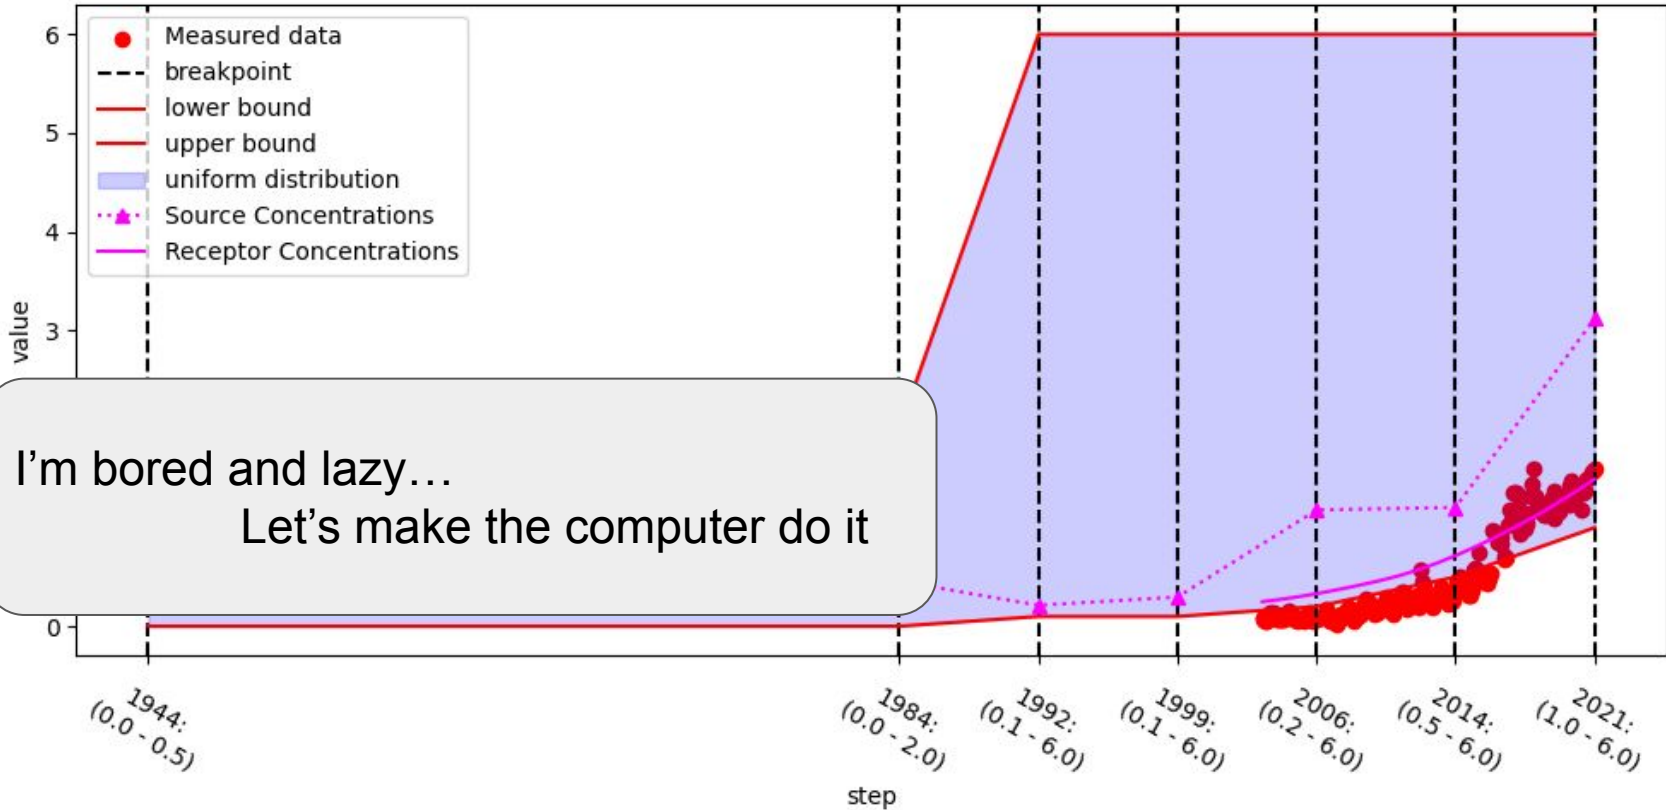

# How? Let's select another and try it out

**Not terrible!**

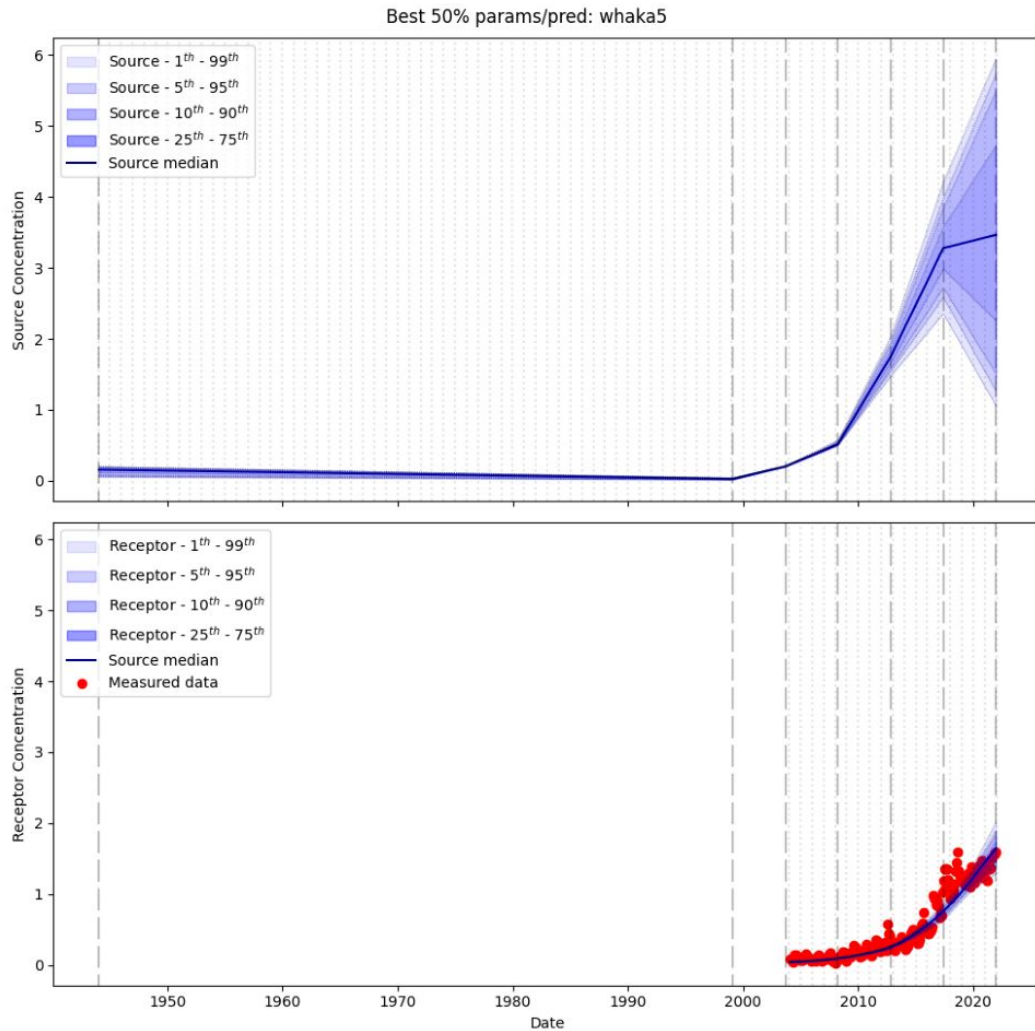

# How? Let's select another and try it out

Not terrible!

... add some  
Bayesian magic  
➔  
**THE POSTERIOR**

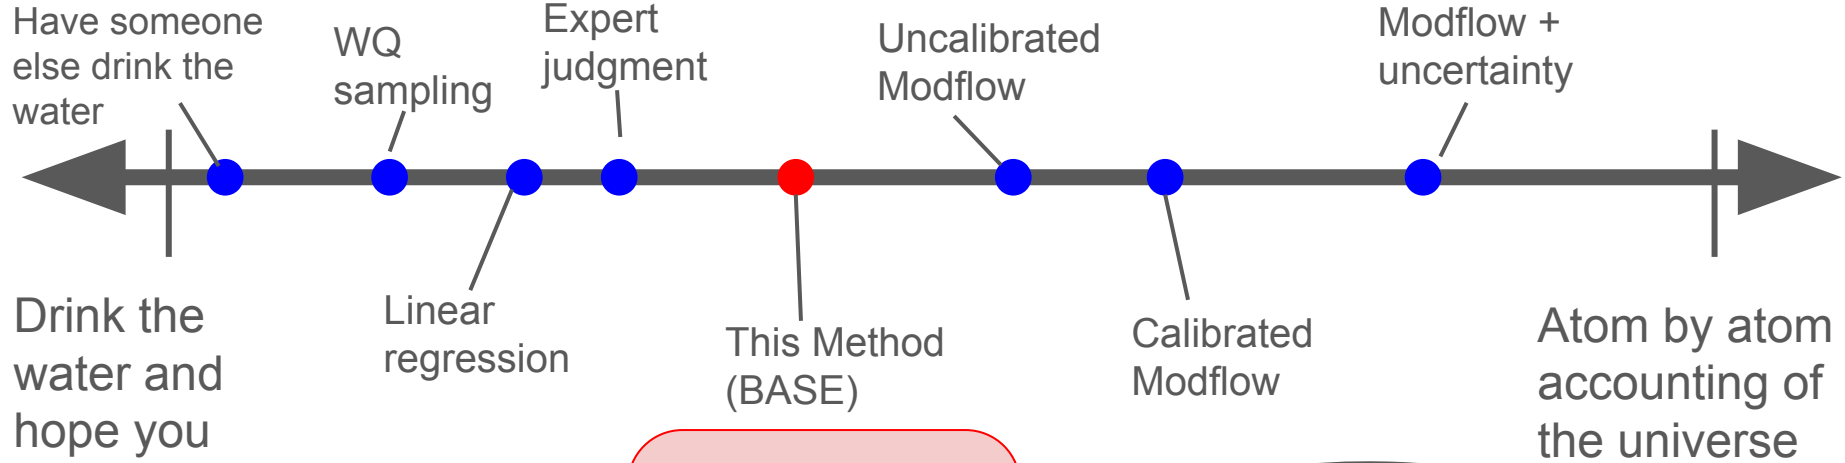

# Let's state the method assumptions

1. The source area remains static over time → *you don't need to know where it is just that it's not changing*
2. The age **distribution** is accurate
3. The age distribution does not change with time
4. The prior distribution includes the true source concentration

It's data driven and does not rely on other upstream models (like Overseer)

# So just how complicated is this? *(not perfectly to scale)*

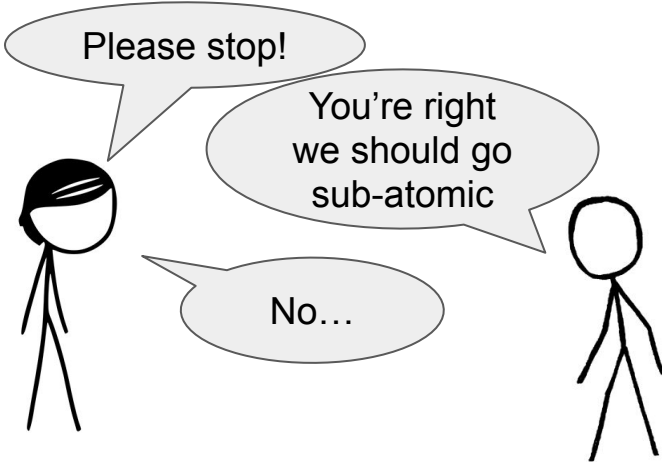

Drink the water and hope you don't die

This might be unpopular with stakeholders...

I ran all 287 wells in NZ in 24-48 hours with 32 cores

# Example Problem 1

→What the @#\$\$% is happening here?

## Stats

Site = L36/0948

Region = Canterbury

MRT = 18.5

F\_p1 = 0.5

# Example Problem 1 → What the @#\$\$% is happening here?

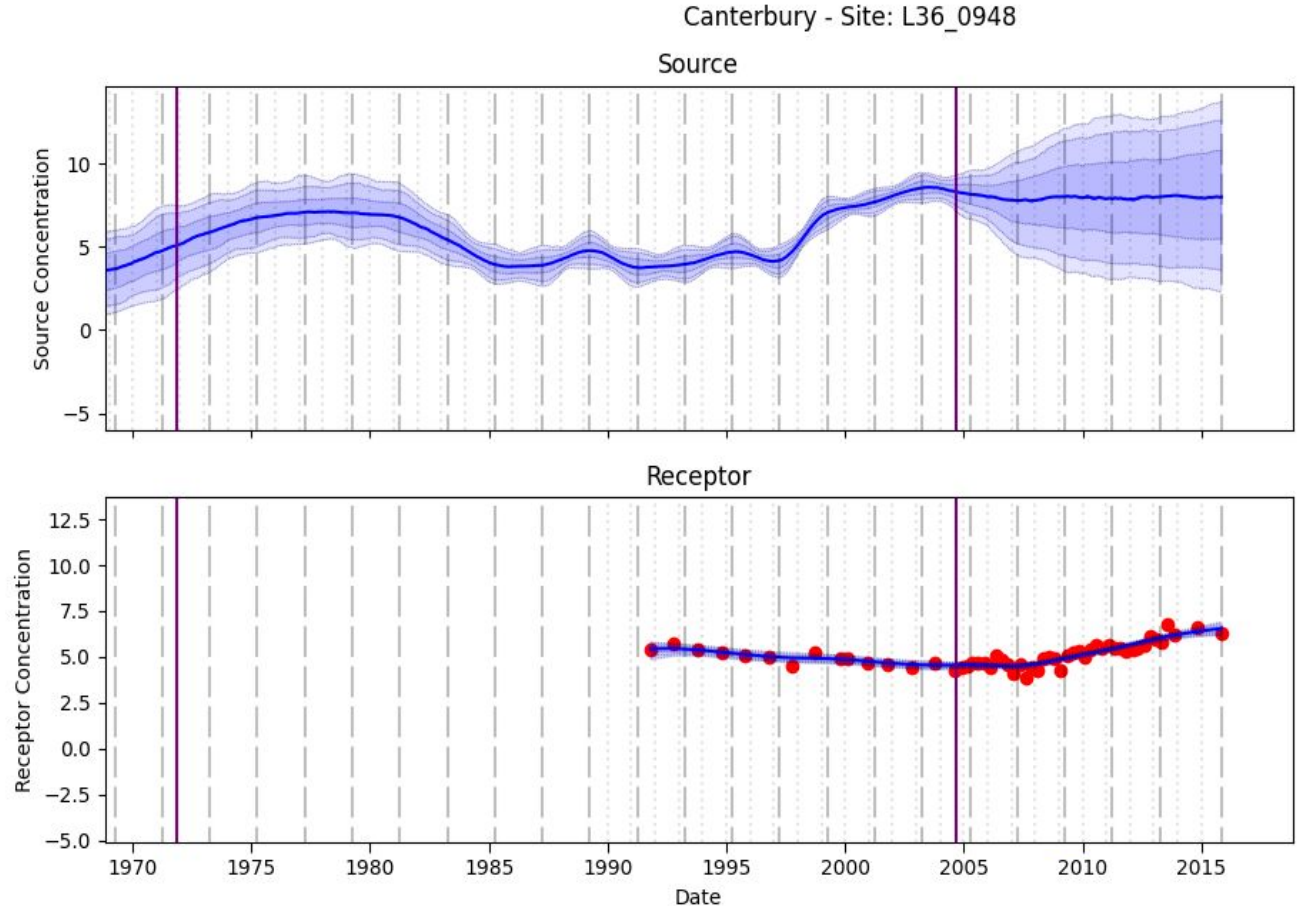

## Stats

Site = L36/0948

Region = Canterbury

MRT = 18.5

F\_p1 = 0.5

# Example Problem 1 → What the @#\$\$% is happening here?

## Stats

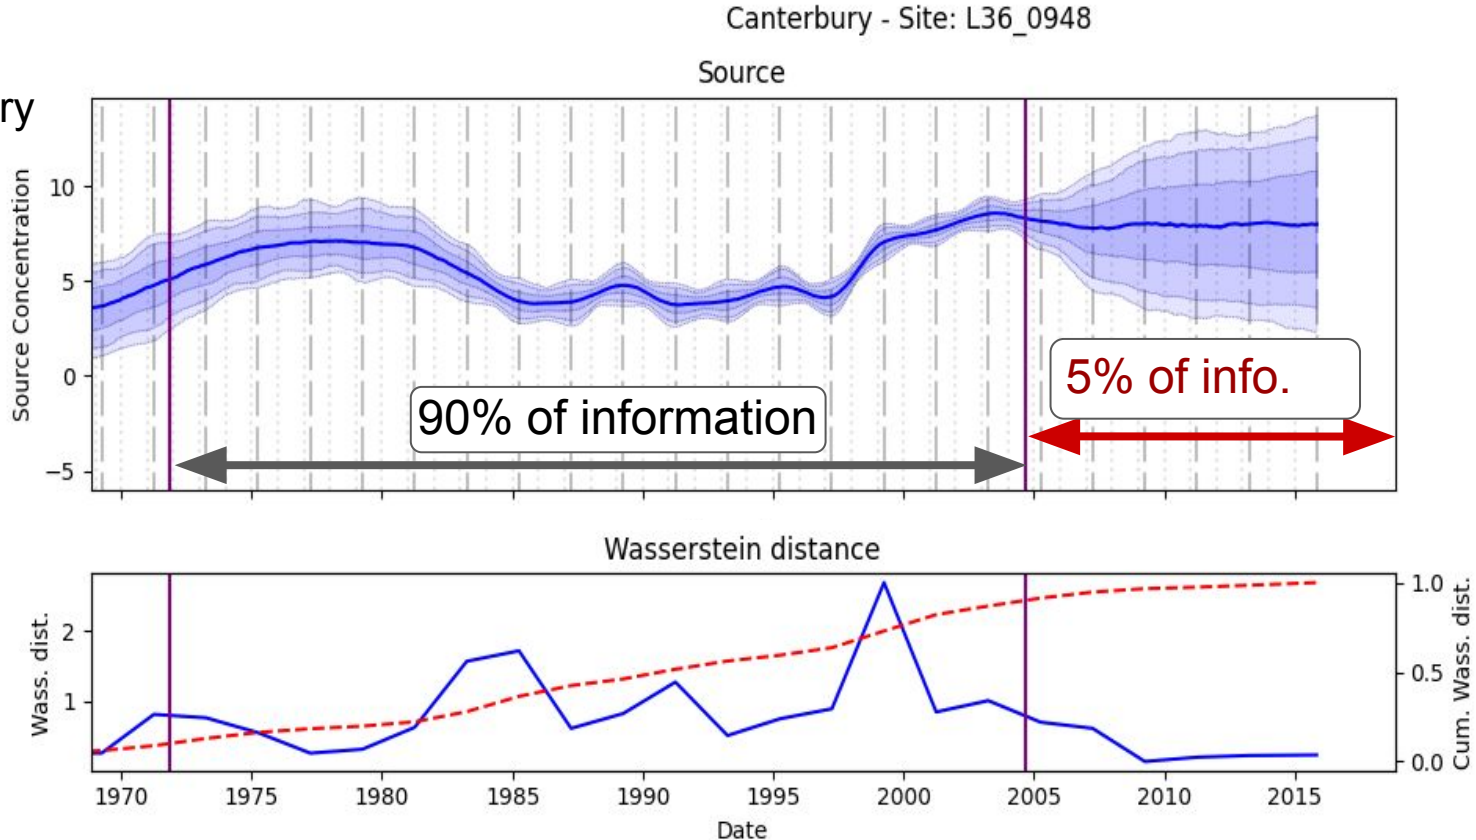

Site = L36/0948

Region = Canterbury

MRT = 18.5

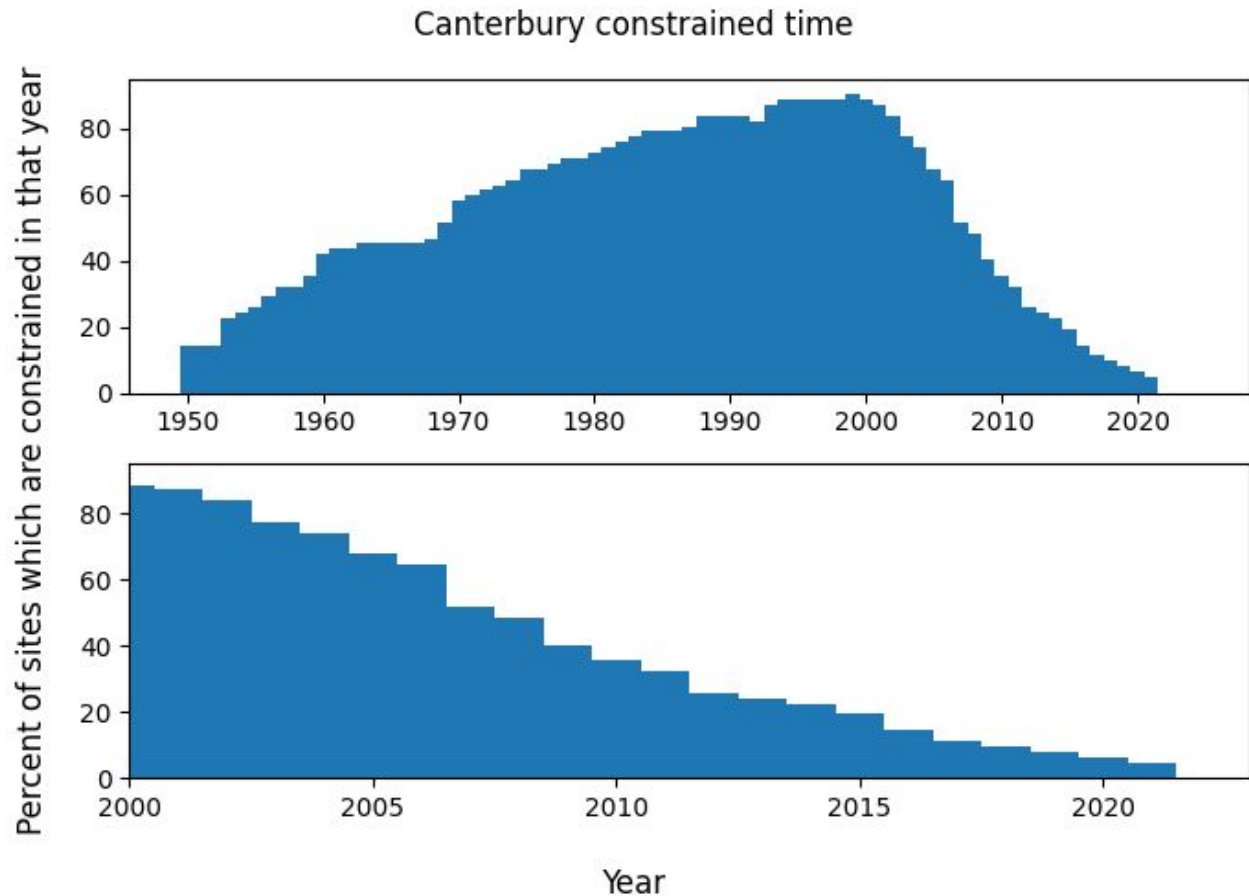

F\_p1 = 0.5

- Bore Depth (m): 66.4
- Full SKendall: increasing
- Lag: 18.5
- MRT1: 18.5
- Exp frac. p1: 0.500
- Frac 1: 1.0
- 5% - 95%
- 10% - 90%
- 25% - 75%
- median
- Measured data
- 90% Wasserstein limit
- Wass. dist.
- Cum. Wass. dist. (normalised)

Now let's go  
for something  
a bit more  
*Majestic*

*When are we  
sampling?*

# Example Problem 2 → Where are we going?

*What will steady state  $\text{NO}_3\text{-N}$  be?*

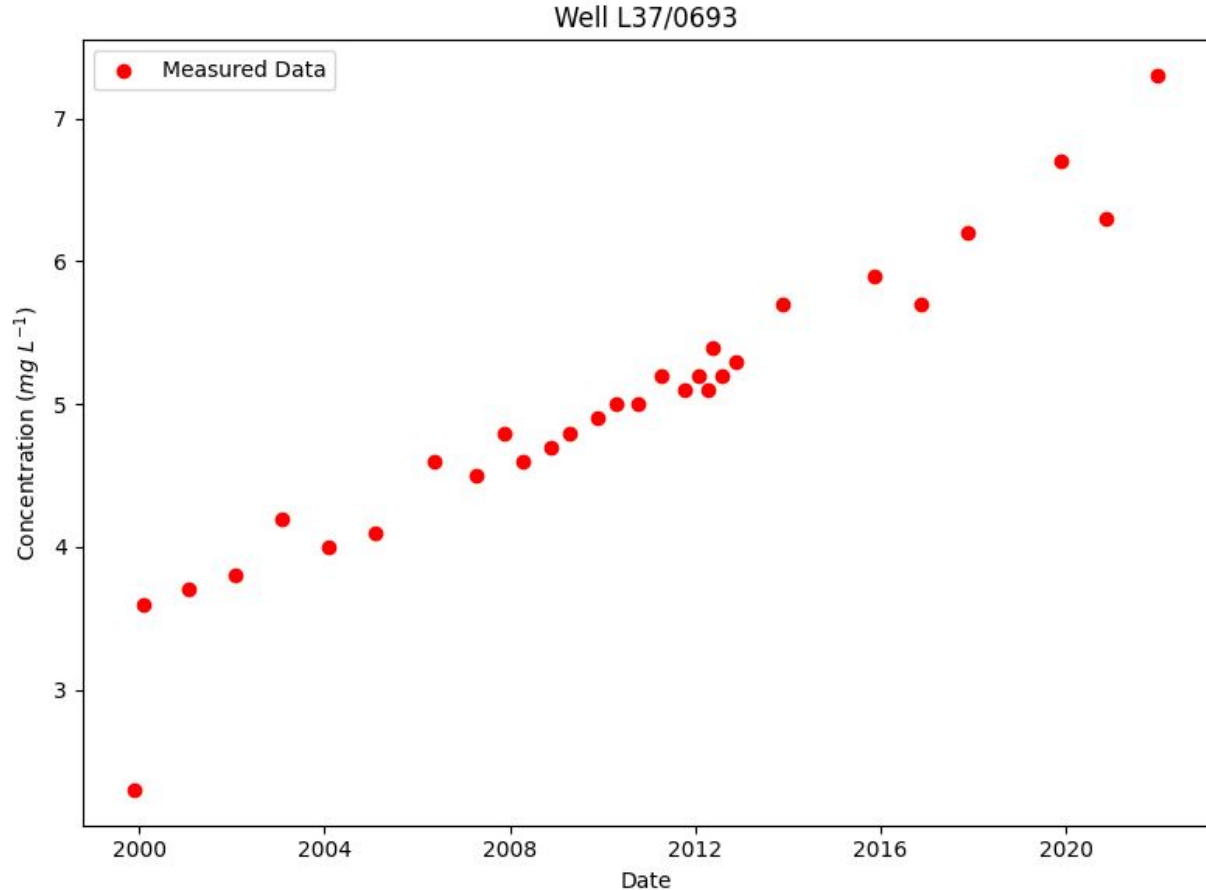

## Stats

Site = L37/0693

Region = Canterbury

MRT = 46

F\_p1 = 0.5

# Example Problem 2

→ Where are we going?

*What will steady state  $\text{NO}_3\text{-N}$  be?*

*If we assume minimal changes: **median of 12.9 mg/l***

## Stats

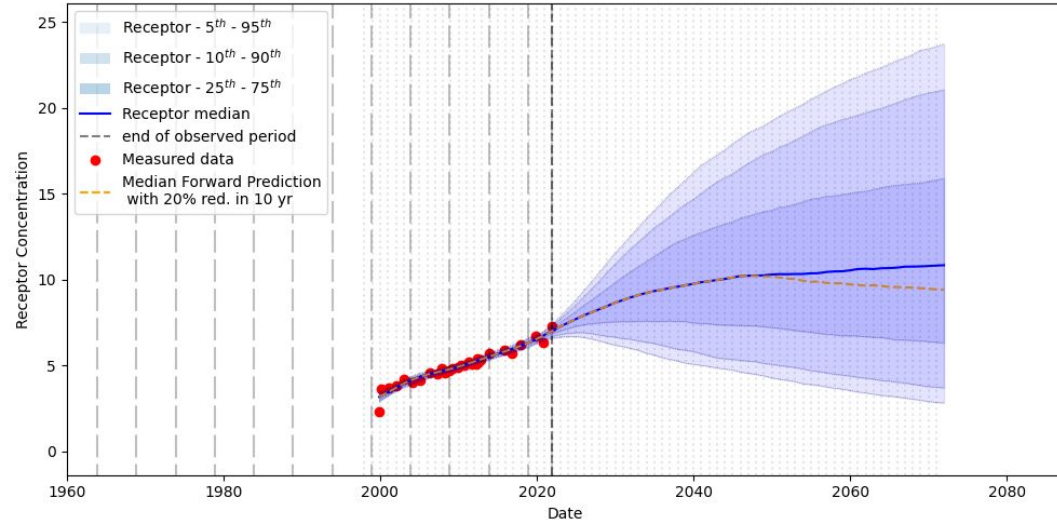

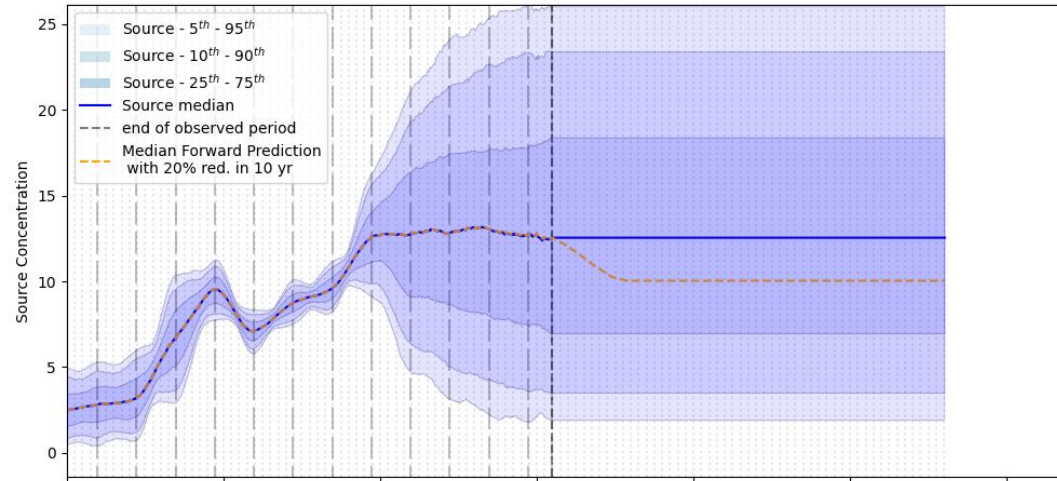

Site = L37/0693

Region = Canterbury

MRT = 46

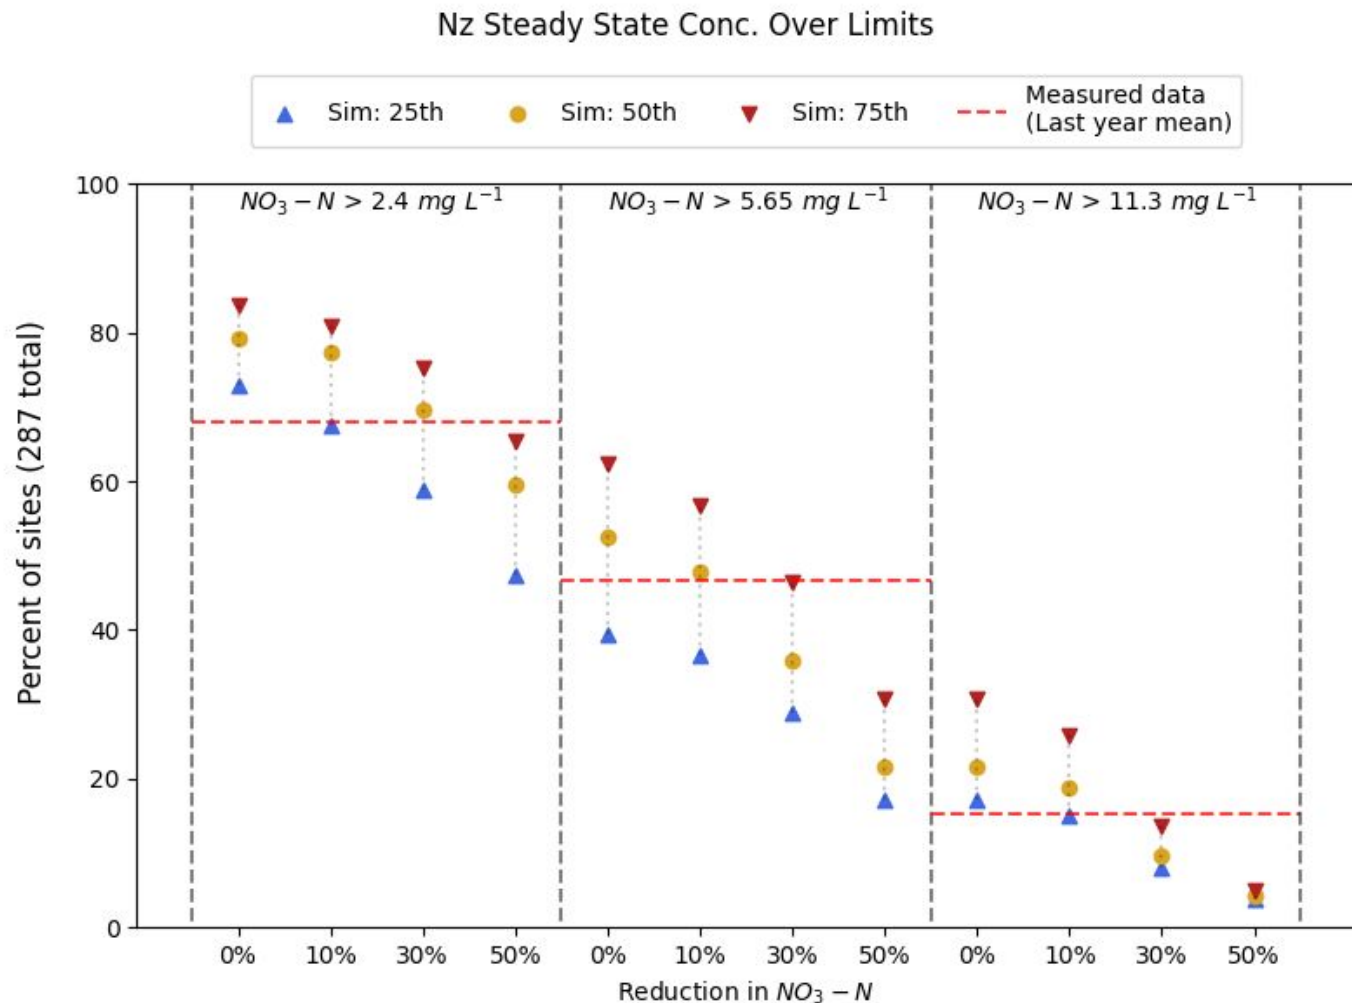

F\_p1 = 0.5

Best 20% params/pred: Canterbury\_L37\_0693\_akima\_None\_normal\_base\_v1\_tuke

Now let's go  
for something  
a bit more  
*majestic*

*What will steady  
state  $\text{NO}_3\text{-N}$   
be?*

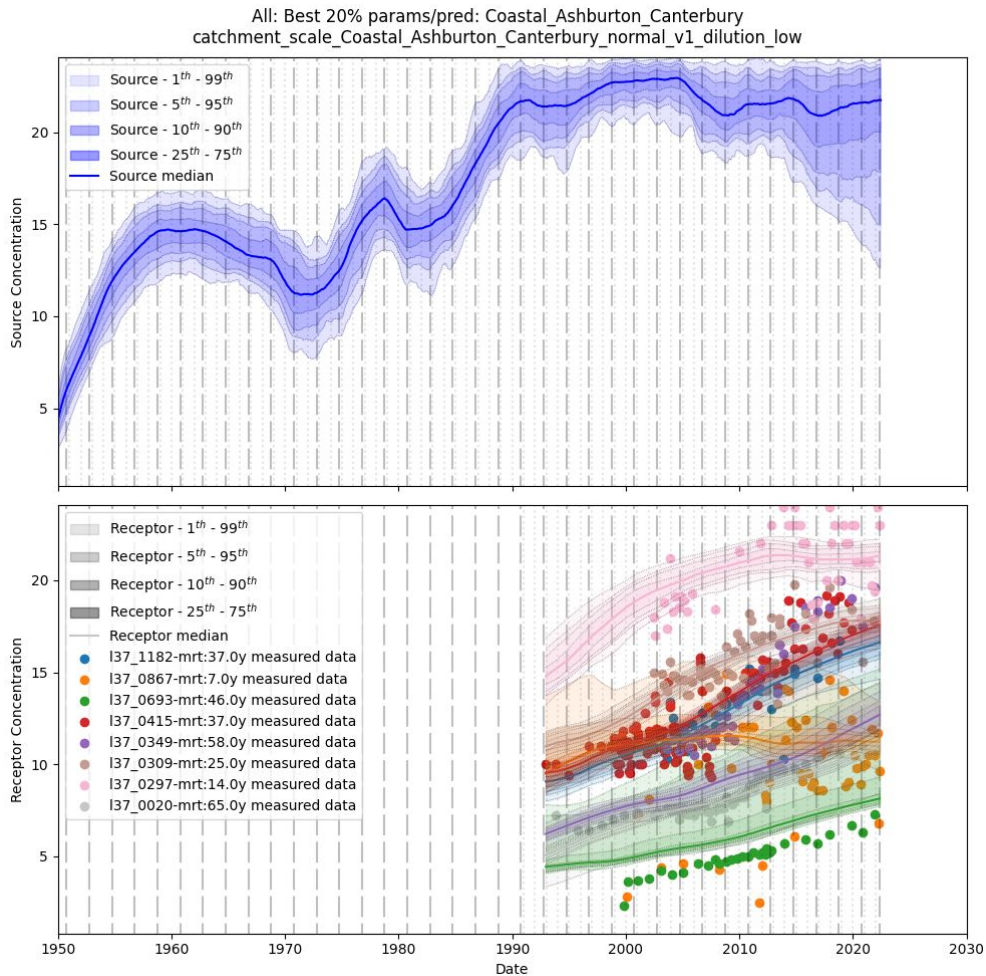

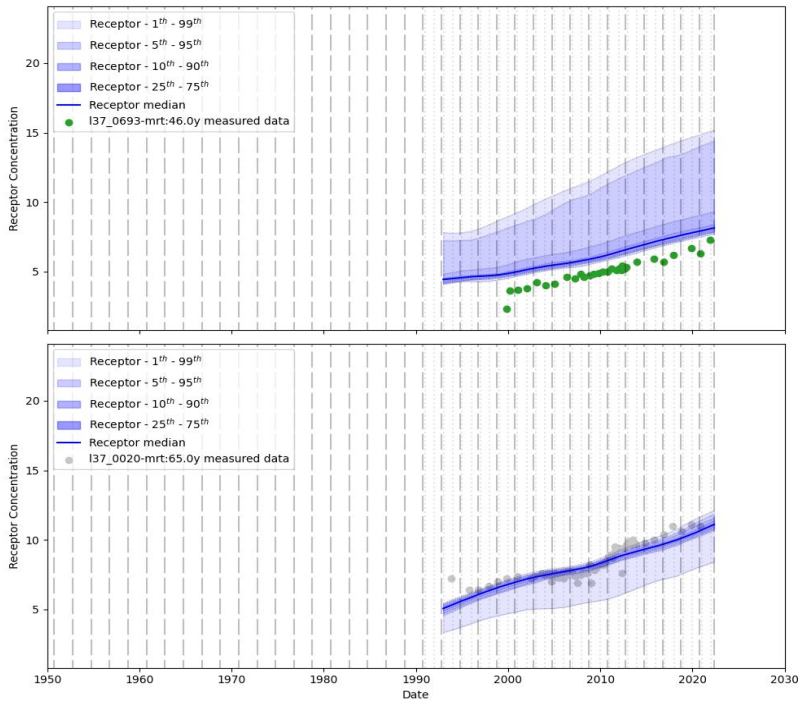

# Conclusions

1. Our BASE technique is can allow the user to:
  - a. Estimate the historical concentration of source zone (leaching area).
  - b. Give an estimate of the likely long term (steady state) concentration of a well.
  - c. Predict how changes in the source zone will affect concentrations in the well.
2. BASE is data driven and does not rely on upstream models like Overseer.
3. It is quick to run and is much more lightweight than other models (e.g., Modflow).
4. It can provide an independent parallel line of evidence for forward modelling.
5. Other information can be brought into the prior to test whether the prior is consistent with the observed data.
6. Open source python package (soon):  
<https://github.com/Komanawa-Solutions-Ltd/komanawa-BASE>
7. We are in the process of writing a paper on the technique.

# Example Problem 3

→ Are these wells showing the same thing?

# Example Problem 3

→ Are these wells showing the same thing?
